### 1. Install and configure GNU privacy guard (GNUPG)

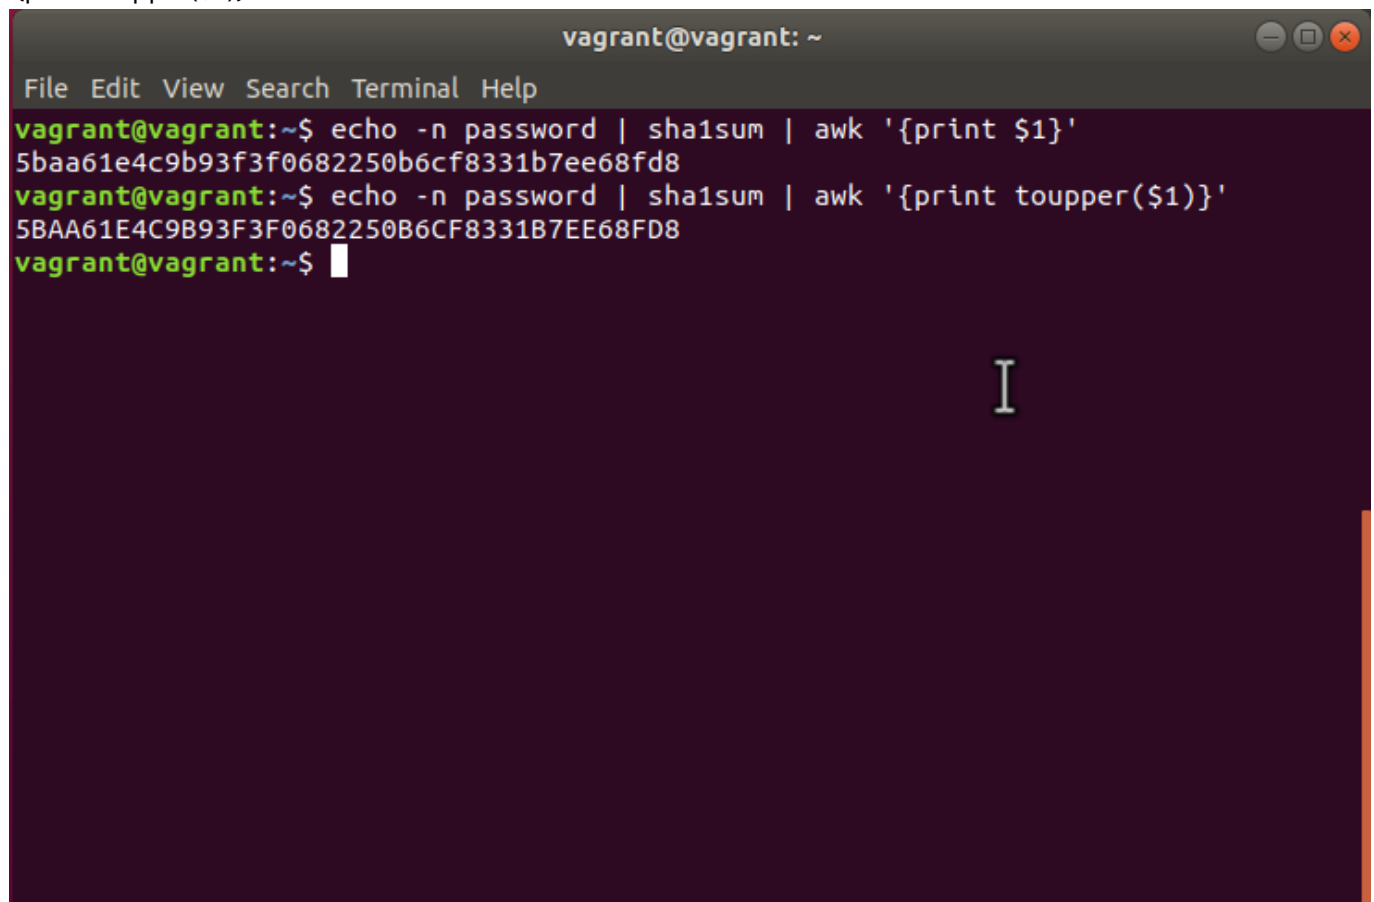

2. Generate a SHA1 hash from the command-line in Linux`

```
vagrant@vagrant:~$ echo -n password | sha1sum | awk '{print $1}'
```

```
5baa61e4c9b93f3f0682250b6cf8331b7ee68fd8 vagrant@vagrant:~$ echo -n password | sha1sum | awk
```

```
'{print toupper($1)}' 5BAA61E4C9B93F3F0682250B6CF8331B7EE68FD8
```

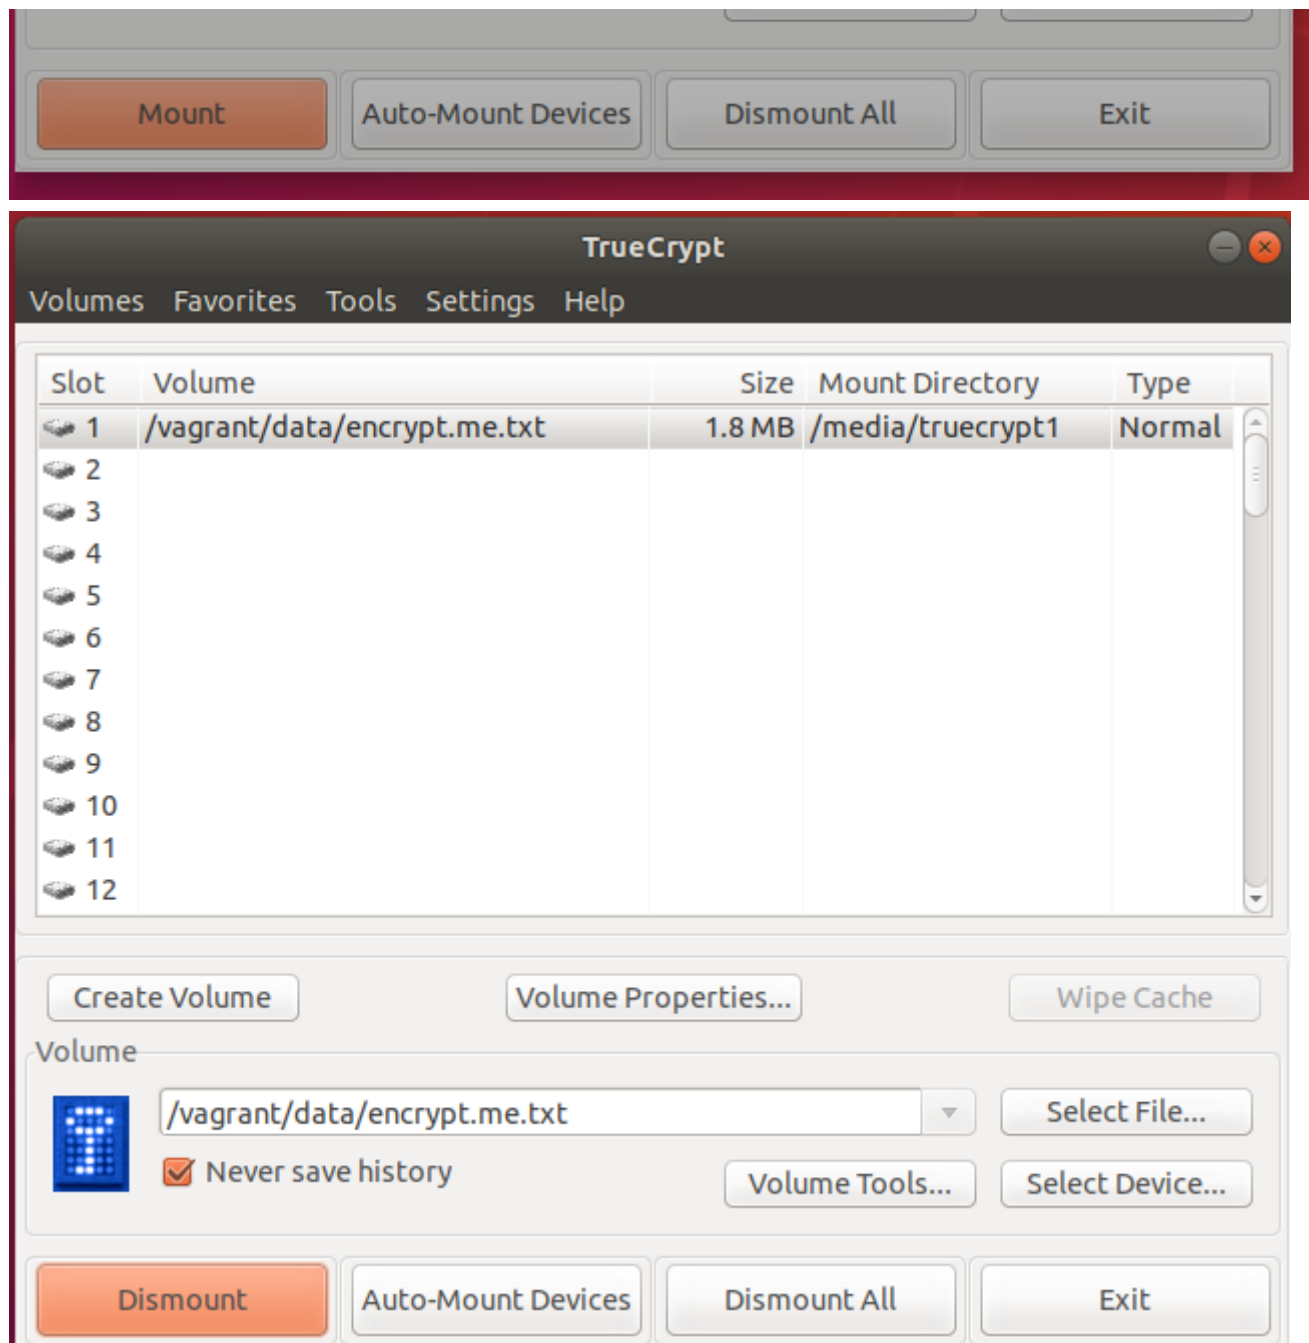

A terminal window titled 'vagrant@vagrant: ~' with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal shows two commands and their outputs. The first command is `echo -n password | sha1sum | awk '{print $1}'`, which outputs `5baa61e4c9b93f3f0682250b6cf8331b7ee68fd8`. The second command is `echo -n password | sha1sum | awk '{print toupper($1)}'`, which outputs `5BAA61E4C9B93F3F0682250B6CF8331B7EE68FD8`. The prompt `vagrant@vagrant:~$` is shown at the end of the second line with a cursor.

```
vagrant@vagrant: ~  
File Edit View Search Terminal Help  
vagrant@vagrant:~$ echo -n password | sha1sum | awk '{print $1}'  
5baa61e4c9b93f3f0682250b6cf8331b7ee68fd8  
vagrant@vagrant:~$ echo -n password | sha1sum | awk '{print toupper($1)}'  
5BAA61E4C9B93F3F0682250B6CF8331B7EE68FD8  
vagrant@vagrant:~$
```

### 3. Install and configure TrueCrypt

4. Send encrypted email (includes exchanging digital certificates and decrypting email)

### Encrypt
